Bonjour,

qui peut me traduire ce code VBScript en Windev ?

Peut être Carlo ?

Merci a vous

```
<script language="VBScript"> Sub ReadDirectory() Dim Result Dim FName Dim Index Dim Count Dim FItem Count = DirList.length For Index = 0 to Count - 1 DirList.Remove 0 Next Set namedObj = Nothing Set namedObj = CreateObject("UnitechAmericaInc.OnlineCom") If NOT IsObject(namedObj) Then Exit Sub If namedObj.Ready <> 1 Then MsgBox "OnlineDII.DII is missing!" Set namedObj = Nothing Exit Sub End If Result = namedObj.SetupEx(1, 38400, 1, "N") Result = namedObj.Connect() If Result<>1 Then MsgBox "Com1 is not available!" Set namedObj = Nothing Exit Sub End If ; Read Directory Index = 1 Result = namedObj.FindFirst("A") FName = namedObj.FindName Do While FName<>"" Set FItem = document.createElement("OPTION") DirList.options.add(FItem) FItem.innerText = FName FItem.value = Index Index = Index + 1 Result = namedObj.FindNext ("A") FName = namedObj.FindName Loop Call namedObj.Disconnect() Set namedObj = Nothing End Sub</script>
```
